

THE INDEPENDENT INSTITUTE OF EDUCATION

WEDE5020 – Web Development (Introduction)

Portfolio of Evidence (POE): Part 1

Website Development Project Proposal

Project Title: NovaTech Computer Solutions (Pty) Ltd Website Development

Student Name: ARSHAD GAJ

Student Number: ST10474894

Submission Date: 14/08/2026

Target Audience

The target audience for the NovaTech Computer Solutions website includes students, home computer users, schools, educational institutions and small businesses in Johannesburg and surrounding areas. Students and home users may require affordable computers, laptops, accessories, repairs, software installation and general technical support, while schools and small businesses may require networking, maintenance and ongoing IT assistance. Because these users have different levels of technical knowledge, the website will use clear language, straightforward navigation and easy-to-find product, service, enquiry and contact information. This will allow visitors to understand NovaTech's offerings and identify the support that best meets their needs.

Website Proposal 1

NovaTech Computer Solutions (Pty) Ltd

NovaTech Computer Solutions (Pty) Ltd is a proposed information technology business based in Johannesburg, Gauteng. The business will provide computer and laptop sales, repairs, software installation, networking solutions and general IT support. NovaTech currently has no dedicated website, meaning customers would mainly rely on telephone communication, social media and word-of-mouth referrals for information. The proposed website will establish a professional online presence where customers can conveniently learn about the business, explore its products and services, submit enquiries and access contact information.

Goals

The main goal of the website is to make NovaTech's products and IT services easier for customers to discover and understand. The website aims to improve customer communication, promote available products and services, provide accessible business information and allow customers to submit enquiries or quotation requests. Success will be measured by whether users can navigate between all six pages, locate relevant information quickly and access the enquiry and contact options without difficulty.

Proposed website features

The website will consist of six interconnected pages: Home, About Us, Products, Services, Enquiry and Contact. The Home page will introduce NovaTech and provide an overview of the business, while About Us will present its background, mission and vision. Products and Services will explain the technology products and IT support available. The Enquiry page will allow customers to request product or service information and quotations, while Contact will provide the business's contact details, operating hours and location. A consistent navigation menu will connect all six pages, allowing users to move through the website easily.

Design

The proposed design will be modern, clean and technology-focused, using dark blue, white and orange as the main colours with clear, readable typography. Part 1 will focus strictly on HTML5 to establish the website structure, content, navigation, images and basic form functionality. Visual Studio Code will be used for development, while Google Chrome and Microsoft Edge will be used to test page display and navigation. CSS and JavaScript will be introduced only in later stages to enhance the website's presentation and interactivity.

Timeline and Budget.

The project is expected to take approximately four weeks. Week 1 will focus on planning and research, Week 2 on content gathering, sitemap and website structure, Week 3 on HTML5 development, and Week 4 on browser testing, GitHub documentation and final preparation. An estimated budget of R2,500 is allocated for domain registration, hosting, graphic resources, internet/data and other project-related expenses.
